## 1. Introduction

## 2. $\mathbb{C}$ -ringed space

**Definition 2.1.** A  $\mathbb{C}$ -ringed space is a pair  $(X, \mathcal{O}_X)$  consisting of a topological space  $X$  and a sheaf  $\mathcal{O}_X$  of  $\mathbb{C}$ -algebras on  $X$ .

A *morphism of  $\mathbb{C}$ -ringed spaces*  $f : (Y, \mathcal{O}_Y) \rightarrow (X, \mathcal{O}_X)$  is a pair consisting of a continuous map  $f : Y \rightarrow X$  and a morphism of sheaves of  $\mathbb{C}$ -algebras  $f^\# : f^{-1}\mathcal{O}_X \rightarrow \mathcal{O}_Y$ .

Given two morphisms of  $\mathbb{C}$ -ringed spaces  $f : (Y, \mathcal{O}_Y) \rightarrow (X, \mathcal{O}_X)$  and  $g : (Z, \mathcal{O}_Z) \rightarrow (Y, \mathcal{O}_Y)$ , their *composition* is the morphism  $f \circ g : (Z, \mathcal{O}_Z) \rightarrow (X, \mathcal{O}_X)$  consisting of the continuous map  $f \circ g : Z \rightarrow X$  and a morphism of sheaves  $(f \circ g)^\# = g^\# \circ f^\# : (f \circ g)^{-1}\mathcal{O}_X \xrightarrow{\sim} g^{-1}f^{-1}\mathcal{O}_X \rightarrow \mathcal{O}_Z$ .

When there is no risk of confusion, we say  $X$  is a  $\mathbb{C}$ -ringed space.

It is straightforward to verify that  $\mathbb{C}$ -ringed spaces form a category, which we denote by  $\mathbb{C}\text{-RS}$ . Similarly, we denote by  $\mathcal{R}\text{S}$  the category of ringed spaces defined in [Stacks, Tag 0090].

In fact, by definition a  $\mathbb{C}$ -ringed space is nothing but a morphism in the category of ringed spaces  $X \rightarrow \mathbb{C}^0$ , where  $\mathbb{C}^0$  is a single point  $*$  endowed with the sheaf of rings  $\mathcal{O}_{\mathbb{C}^0}$  with  $\mathcal{O}_{\mathbb{C}^0}(*) = \mathbb{C}$ . In terms of slice categories, we have a canonical equivalence of categories

$$\mathbb{C}\text{-RS} \approx \mathcal{R}\text{S}/\mathbb{C}^0.$$

From this identification, most of the basic results above  $\mathbb{C}\text{-RS}$  follows, which we will use freely.

There is an obvious faithful forget functor  $\mathbb{C}\text{-RS} \rightarrow \mathcal{R}\text{S}$ .

**Definition 2.2.** A *locally  $\mathbb{C}$ -ringed space* is a  $\mathbb{C}$ -ringed space  $(X, \mathcal{O}_X)$  which when regarded as a ringed space is a locally ringed space.

A *morphism* between two locally  $\mathbb{C}$ -ringed spaces is a morphism between the underlying  $\mathbb{C}$ -ringed spaces which is a morphism of locally ringed spaces at the same time.

The category of locally  $\mathbb{C}$ -ringed spaces is denoted by  $\mathbb{C}\text{-LRS}$ .

We refer to [Stacks, Tag 01HA] for the notion of locally ringed spaces. Similar to the case of  $\mathbb{C}$ -ringed space, we have a canonical equivalence of categories

$$\mathbb{C}\text{-LRS} \approx \mathcal{L}\text{RS}/\mathbb{C}^0.$$

**Example 2.3.** Let  $n \in \mathbb{N}$ , we define a sheaf of  $\mathbb{C}$ -algebras  $\mathcal{O}_{\mathbb{C}^n}$  on  $\mathbb{C}^n$  as follows: for any open subset  $U \subseteq \mathbb{C}^n$ ,  $\mathcal{O}_{\mathbb{C}^n}(U)$  is the  $\mathbb{C}$ -algebra of holomorphic functions on  $U$ . It is easy to see that  $\mathcal{O}_{\mathbb{C}^n}$  is a sheaf and  $(\mathbb{C}^n, \mathcal{O}_{\mathbb{C}^n})$  is a  $\mathbb{C}$ -ringed space. Moreover, it is easy to show that  $(\mathbb{C}^n, \mathcal{O}_{\mathbb{C}^n})$  is a locally  $\mathbb{C}$ -ringed space.

## 3. Complex model spaces and complex analytic spaces

**Definition 3.1.** Given any domain  $D$  in  $\mathbb{C}^n$ , we can define a sheaf of  $\mathbb{C}$ -algebras  $\mathcal{O}_D$  on  $D$  as the restriction of  $\mathcal{O}_{\mathbb{C}^n}$  defined in Example 2.3 to  $D$ . Observe that  $(D, \mathcal{O}_D)$  is a locally  $\mathbb{C}$ -ringed space.

**Definition 3.2.** A *complex model space* is a  $\mathbb{C}$ -ringed space  $(X, \mathcal{O}_X)$  such that there exist

- (1) a domain  $D$  in  $\mathbb{C}^n$  for some  $n \in \mathbb{N}$  and

(2) an ideal sheaf  $\mathcal{I}$  in  $\mathcal{O}_D$  of finite type  
such that there is an isomorphism

$$(X, \mathcal{O}_X) \cong (\text{Supp } \mathcal{O}_D/\mathcal{I}, i^{-1}(\mathcal{O}_D/\mathcal{I}))$$

in the category of  $\mathbb{C}\text{-}\mathcal{RS}$ , where  $i : \text{Supp } \mathcal{O}_D/\mathcal{I} \rightarrow D$  is the inclusion map. Here  $\mathcal{O}_D$  is the sheaf of  $\mathbb{C}$ -algebras defined in [Definition 3.1](#).

Clearly,  $(X, \mathcal{O}_X)$  is a locally  $\mathbb{C}$ -ringed space.

Observe that  $X$  is always a Hausdorff space.

**Definition 3.3.** A *complex analytic space* is a locally  $\mathbb{C}$ -ringed space  $(X, \mathcal{O}_X)$  such that

- (1)  $X$  is a Hausdorff space.
- (2) For any  $x \in X$ , there is an open neighbourhood  $U \subseteq X$  of  $x$  such that  $(U, \mathcal{O}_U := \mathcal{O}_X|_U)$  is isomorphic to a complex model space in the sense of [Definition 3.2](#) in the category  $\mathbb{C}\text{-}\mathcal{LRS}$ .

When there is no risk of confusion, we also omit  $\mathcal{O}_X$  from the notation say  $X$  is a complex analytic space.

A morphism between complex analytic spaces is a morphism of the underlying locally  $\mathbb{C}$ -ringed spaces. Such a morphism is also known as a *holomorphic map*.

**Remark 3.4.** It seems that all authors on this subject requires that complex analytic spaces be Hausdorff, which may seem unnatural from the eyes of an algebro-geometrist. Morally, Hausdorffness corresponds to separatedness in the scheme world. However, non-Hausdorff analytic spaces do not seem to play a major role, in contrast to non-separated schemes, so we stick to the current definition.

**Remark 3.5.** Most of the authors require extra conditions in the definition of a complex analytic space:  $\sigma$ -compactness, paracompactness, having countable basis etc. We will not put these constraints in the definition, instead, we choose to include them into the assumptions of the theorems.

#### 4. Weierstrass map

#### 5. Oka's coherence theorem

This lemma needs to be placed elsewhere. Proof at CAS p58 needs to be included

**Lemma 5.1.** *Let  $X$  be a topological space and  $\mathcal{A}$  be a Hausdorff sheaf of rings on  $X$  (in the sense that the espace étalé of  $\mathcal{A}$  is Hausdorff) such that all stalks of  $\mathcal{A}$  are integral domains. Then  $\mathcal{A}$  is coherent if and only if for any open set  $V \subseteq X$  and any section  $s \in \mathcal{A}(V)$ ,  $\mathcal{A}_V/s\mathcal{A}_V$  is coherent at every  $x \in V$  where  $s_x \neq 0$ .*

**Lemma 5.2** (Oka). *For any  $n \in \mathbb{N}$ ,  $\mathcal{O}_{\mathbb{C}^n}$  is coherent.*

PROOF. As a preparation, observe that  $\mathcal{O}_{\mathbb{C}^n}$  is a Hausdorff sheaf.

For any two germs  $s_i \in \mathcal{O}_{\mathbb{C}^n, a_i}$  ( $i = 1, 2$ ), we need to construct disjoint open neighbourhoods  $U_i$  in the espace étalé of  $\mathcal{O}_{\mathbb{C}^n}$  of  $s_i$ . If  $a_1 \neq a_2$ , the assertion is clear. So assume that  $a_1 = a_2 = 0$ . We extend  $s_i$  to  $f_i \in \mathcal{O}_{\mathbb{C}^n}(U)$  for a connected open neighbourhood  $U \subseteq \mathbb{C}^n$  of 0. Then  $\{f_x : x \in U\}$  and  $\{g_x : x \in U\}$  are disjoint: if for some  $z \in U$ ,  $f_z = g_z$ , then the same holds in a neighbourhood of  $z$  and so  $f = g$  on  $U$  by Identitätssatz. Include the proof

We will prove the coherence of  $\mathcal{O}_{\mathbb{C}^n}$  by induction on  $n$ . The case  $n = 0$  is trivial. Assume that  $n > 0$  and the theorem has been proved for all smaller  $n$ . We will apply [Lemma 5.1](#). Take an open set  $U \subseteq \mathbb{C}^n$  and  $g \in \mathcal{O}_{\mathbb{C}^n}(U)$ . We need to show that  $\mathcal{O}_U/g\mathcal{O}_U$  is coherent at all  $x \in U$  with  $g_x \neq 0$ .

Fix such a point  $x$ , which may be assumed to be 0. We may assume that  $g(0) = 0$  as otherwise, the stalk of  $\mathcal{O}_U/g\mathcal{O}_U$  at 0 is trivial. By perturbing the coordinates, we may guarantee that  $g_0(0, w)$  is not identically 0 for  $w \in \mathbb{C}$ . By Weierstrass preparation theorem [Include a proof](#), there is a monic polynomial  $\omega_0 \in \mathcal{O}_{\mathbb{C}^{n-1}, 0}[w]$  such that  $g_0\mathcal{O}_{\mathbb{C}^n, 0} = \omega_0\mathcal{O}_{\mathbb{C}^n, 0}$ . Lift  $\omega_0$  to  $\omega \in \mathcal{O}_{\mathbb{C}^{n-1}}(B)$  for some neighbourhood  $B \subseteq \mathbb{C}^{n-1}$  of 0. In order to show the coherence of  $\mathcal{O}_U/g\mathcal{O}_U$  near 0, it suffices to show that  $\mathcal{O}_{B \times \mathbb{C}}/\omega\mathcal{O}_{B \times \mathbb{C}}$  near 0. Let  $A = Z(\omega) \subseteq B \times \mathbb{C}$  be the closed subspace defined by the coherent sheaf generated by  $\omega$ , then it suffices to show that  $\mathcal{O}_A$  is coherent near 0. Now we have the finite Weierstrass morphism  $A \rightarrow B$  [Include](#), it suffices to prove the coherence of  $\mathcal{O}_B$ , which follows from inductive hypothesis.  $\square$

As a corollary, we have the important Oka's coherence theorem.

**THEOREM 5.3.** *Let  $X$  be a complex analytic space, then  $\mathcal{O}_X$  is coherent.*

**PROOF.** The problem is local on  $X$ , so we may assume that  $X$  is a complex model space, say there is a closed immersion into a domain  $D$  in  $\mathbb{C}^n$  defined by an ideal of finite type  $\mathcal{I}$ . By [Lemma 5.2](#),  $\mathcal{O}_D$  is coherent and hence  $\mathcal{I}$  is coherent. It follows that  $\mathcal{O}_D/\mathcal{I}$  is coherent and hence  $\mathcal{O}_X$  is coherent.  $\square$

## 6. Implicit function theorem

**THEOREM 6.1.** *Let  $X$  be a complex analytic space and  $x \in X$ . Then  $\mathcal{O}_{X, x}$  is strictly Henselian.*

## 7. Rückert Nullstellensatz

Let  $X$  be a complex analytic space. It is a sheaf of  $\mathbb{C}$ -algebras. For any sheaf of local  $\mathbb{C}$ -algebras  $\mathcal{A}$  on  $X$ , any open set  $U \subseteq X$  and any  $s \in \mathcal{A}_X(U)$ . We want to construct a function  $[s] : U \rightarrow \mathbb{C}$ .

Take  $x \in U$ , there is a canonical splitting

$$(7.1) \quad \mathcal{A}_x \cong \mathbb{C} \oplus \mathfrak{m}_x,$$

where  $\mathfrak{m}_x$  is the maximal ideal of  $\mathcal{A}_x$ . Then we define  $[s](x)$  as the image of  $s_x$  in the  $\mathbb{C}$ -factor in [\(7.1\)](#).

**Definition 7.1.** Let  $X, \mathcal{A}, U, x, s$  be as above. The value  $[s](x) \in \mathbb{C}$  is called the *value* of  $s$  at  $x$ . We sometimes denote it by  $s(x)$  as well.

**Lemma 7.2.** *Let  $X$  be a complex analytic space. We denote by  $\mathcal{C}_X$  the sheaf of continuous functions on  $X$ . The association  $s \mapsto [s]$  in [Definition 7.1](#) defines a homomorphism of sheaves of  $\mathbb{C}$ -algebras  $\mathcal{O}_X \rightarrow \mathcal{C}_X$ .*

When there is no risk of confusion, we also write  $s$  instead of  $[s]$ .

**PROOF.** We need to show that for any open set  $U \subseteq X$  and any  $s \in \mathcal{O}_X(U)$ ,  $[s]$  is a continuous function on  $U$ .

We may clearly assume that  $U = X$ . The problem is local on  $X$ , so we may assume that  $X$  is a complex model space in the sense of [Definition 3.2](#) defined by a coherent ideal  $\mathcal{I}$  in a domain  $D$  in  $\mathbb{C}^n$ . By further localizing, we may assume that  $s$

can be lifted to a section  $f \in \mathcal{O}_D(D)$ . Then  $[s] = f|_X$  by definition. So the assertion follows from the fact that a holomorphic function on a domain is continuous.  $\square$

**THEOREM 7.3** (Rückert Nullstellensatz). *Let  $X$  be a complex analytic space and  $\mathcal{F}$  be a coherent sheaf of  $\mathcal{O}_X$ -modules. Let  $f \in \mathcal{O}_X(X)$  be a function that vanishes on  $\text{Supp } \mathcal{F}$ . Then for any  $x \in X$ , there is an open neighbourhood  $U \subseteq X$  of  $x$  and  $m \in \mathbb{Z}_{>0}$  such that  $f^m \mathcal{F}|_U = 0$ .*

**PROOF.** We may assume that  $x \in \text{Supp } \mathcal{F}$  as otherwise there is nothing to prove. In particular,  $f(x) = 0$ .

**Step 1.** We first reduce the problem to a relatively simple situation.

The problem is local on  $X$ , so we may assume that there is a domain  $D$  containing 0 in  $\mathbb{C}^n$  and a closed immersion  $\iota : X \rightarrow D$  sending  $x$  to 0. Consider the closed immersion  $g : V \rightarrow D \times \mathbb{C}$  induced by  $\iota$  and  $f$ . Assume that this theorem has been proved for  $w, B \times \mathbb{C}, g_* \mathcal{F}$  in place of  $f, X, \mathcal{F}$  respectively, then we would find an integer  $m \in \mathbb{Z}_{>0}$  such that  $w^m (g_* \mathcal{F})_0 = 0$ . In particular,  $f^m \mathcal{F}_x = 0$ . As  $\mathcal{F}$  is coherent, there is an open neighbourhood  $U \subseteq X$  of  $x$  such that  $f^t \mathcal{F}|_U = 0$ .

**Step 2.** We are reduced to prove the following special case: let  $D$  be a domain in  $\mathbb{C}^n$  containing 0,  $\mathcal{F}$  is a coherent sheaf on  $D$  whose support is contained in  $\{(z, w) \in \mathbb{C}^{n-1} \times \mathbb{C} : (z, w) \in D, w = 0\}$ . Then there is  $m \in \mathbb{Z}_{>0}$  such that  $w^m \mathcal{F}_0 = 0$ .

Let  $\mathcal{G}$  be the annihilator sheaf of  $\mathcal{F}$ :

$$\mathcal{G} := \ker(\mathcal{O}_D \rightarrow \mathcal{H}\text{om}_{\mathcal{O}_D}(\mathcal{F}, \mathcal{F})),$$

where the map  $\mathcal{O}_D \rightarrow \mathcal{H}\text{om}_{\mathcal{O}_D}(\mathcal{F}, \mathcal{F})$  sends a local section  $f$  of  $\mathcal{O}_D$  to the endomorphism of multiplying by  $f$  of  $\mathcal{F}$ . Then  $\mathcal{G}$  is a coherent sheaf by Oka's coherence theorem [Theorem 5.3](#). So it has closed supports. But by our assumption, the support of  $\mathcal{G}$  contains all  $w \neq 0$ , so  $\text{Supp } \mathcal{G} = D$ .

Let  $f \in \mathcal{G}_0$  be a non-zero element. We write [The structure of the local ring needs to be presented earlier](#)

$$f = \sum_{j=b}^{\infty} a_j w^j, \quad a_j \in \mathcal{O}_{\mathbb{C}^{n-1}, 0}, a_b \neq 0$$

for some  $b \in \mathbb{N}$ . We may assume that  $b = 0$  by replacing  $f$  and  $\mathcal{F}$  with  $w^{-b} f$  and  $w^b \mathcal{F}$  respectively. We want to show that  $w^m \mathcal{F}_0 = 0$  for some positive integer  $m$ .

When  $a_0$  is a unit, namely when  $a_0(0) \neq 0$ , then  $f$  is a unit, so  $\mathcal{F}_0 = 0$ . We make an induction on  $n$ . The case  $n = 1$  is trivial, as  $a_0$  is always a unit. So we may assume that  $a_0(0) = 0$  and  $n > 1$ . By perturbing the coordinates in  $\mathbb{C}^{n-1}$ , we may assume that  $a_0$  is not identically zero in the variable  $z_1$ . [We need to finish the Weierstrass theory first.](#)

Shrinking  $D$ , we may assume that  $f$  can be lifted to a holomorphic function  $g \in \mathcal{O}_D(D)$  with  $g \mathcal{F} = 0$ . By our assumption on  $a_0$ , we may assume that  $Z(g) \cap \{(z_1, 0, \dots, 0) \in D\} = \{0\}$ . Hence,  $D \cap \text{Supp } \mathcal{F}$ , which is a subset of  $Z(g)$  also intersects the  $z_1$ -axis only at the origin.

By [To be included](#), we can find a product domain  $B \times W \subseteq D$  with  $B \subseteq \mathbb{C}$  and  $W \subseteq \mathbb{C}^{n-1}$  containing 0 such that the projection  $h : (B \times W) \cap \text{Supp } \mathcal{F} \rightarrow B$  is finite and  $\mathcal{F}' := h_*(\mathcal{F}|_{B \times W})$  is a coherent sheaf of  $\mathcal{O}_B$ -modules. Observe that  $\text{Supp } \mathcal{F}' \subseteq \{(z_2, \dots, z_{n-1}, w) \in B : w = 0\}$ , we can apply the induction hypothesis to obtain  $m \in \mathbb{Z}_{>0}$  such that  $w^m \mathcal{F}'_0 = 0$ . It follows that  $w^m \mathcal{F}_0 = 0$ .  $\square$

**8. Fiber products**

The goal of this section is to show that the category of complex analytic spaces admits finite limits.

**9. Complex analytic topos**
